

Double Your Fraud Defenses!

March Networks® is committed to helping financial customers fully exploit video technologies. For better physical security, yes. But also for better defense against two of the biggest exposures today – ATM and check fraud. These crimes cost global financial institutions billions of dollars annually. The March Networks VideoSphere® IP video hardware and software portfolio helps detect these crimes more rapidly and contain losses more effectively.

Reduce the Time and Cost of Fraud Investigations

With our unique **Financial Transaction Investigation** (FTI) application, ATM and Teller transaction records can be synchronized with corresponding video evidence automatically.

This dramatically improves the search and case management capabilities of your fraud team, which means:

- more rapid investigations, so losses are prevented quickly.
- lower cost per investigation, so more cases are investigated and more recoveries made.
- stronger evidence, so more prosecutions are successful with less time and cost.

It is not unusual for fraud investigations to take days using current processes for requesting transaction records from IT and retrieving and reviewing hours of video from a bank branch.

Now your fraud team can generate better results in minutes, using integrated case management software to access video and data from any ATM or branch, on-line.

The productivity gains can easily enable them to double their recoveries. A major financial customer actually tripled theirs ...

Contact your March Networks representative to find out more today.

Increase the Value of Your Video

Our **IP cameras** capture high-definition images in real-time without the need for high bandwidth networks or large storage reserves. This improves the quality, clarity and usability of your ATM, Teller or other surveillance video:

- more detailed incident evidence, so more perpetrators are caught.
- deeper, richer field of view, for greater coverage per camera.

**New HD IP Camera
Designed for Banks!**

These compact new cameras are available on all our recording platforms. Contact your March Networks representative for details.

VideoSphere intelligent video analytics enable financial organizations to automatically detect a range of incidents that they define as suspicious.

This dramatically improves the ability of security and fraud teams to react to these incidents, and means:

- more immediate situation awareness, so potential crimes are averted or addressed more quickly.
- more detailed fraud defenses, so more cases are detected and investigated, and more losses are contained.
- more consistent coverage, so exposures do not vary with hour of day or day of week.

A range of applications can be applied to banking environments, including detecting a person or people loitering at an ATM or drop-box, for example, or ensuring a clear customer facial image is captured for each ATM or Teller transaction.

More advanced analytics are also being developed to marry data anomalies with video evidence, for example to detect someone at an ATM who is not conducting a transaction, or someone at an ATM who is performing an unusually high number of transactions.
