

Veritone Redact

Cloud-based, intelligent audio and video evidence redaction

For customers who need to redact images and/or audio from their recorded evidence prior to sharing it with a third party, March Networks® Command™ and Searchlight™ software integrate with the Veritone Redact solution to automate the process of obscuring sensitive imagery or audio.

This solution systematically detects sensitive objects within a scene (e.g., human heads, license plates, vehicles, computer screens, etc.), then automatically censors/obscures those objects from your recorded evidence. From there, the redacted evidence can quickly be downloaded — complete with audit logs — to support chain of custody requirements and share it with colleagues and third parties.

Expedite the redaction of audio, video, and image-based evidence

The high cost and time requirements of redacting sensitive information from recorded evidence can take a toll on resources and budgets. Yet this redaction is required to keep witnesses safe and comply with freedom of information laws and consent decrees.

This cloud-based solution automates the process of obscuring sensitive objects or audio in recorded evidence, significantly improving manual and time-intensive, frame-by-frame and word-by-word evidence redaction workflows.

Before redaction: All customers and sensitive customer data are clearly visible

After redaction: Heads and computer monitors have been obscured via Veritone Redact software

Here's how it works...

DETECT

Automatically detect objects of interest, e.g., heads, license plates, computer screens, vehicles, etc., within your video and image-based evidence, then display the results chronologically in a preview pane, as well as within the video player itself.

REDACT VIDEO

Redact those objects of interest within the video by blurring or blocking them. Additional redactions can always be performed if additional personally identifiable information (PII) was missed.

REDACT AUDIO

Mute or bleep sensitive words or phrases within the recorded video, including spoken names, social security numbers, addresses, phone numbers, and more. All audio redaction is transcript-based, so users can read the text for highly accurate review.

DOWNLOAD

Download the redacted video or audio files, and an audit of all actions taken, to your PC.

DEFINE & LIVE TRACK

Select your objects of preference, such as ID cards, notebooks, or any other PII within the video, then track those objects forward in the video. With live tracking, you can define a zone and manually follow that object with your cursor during video playback for subsequent redaction.

AUDIT ACTIVITY

Get comprehensive reports of all actions taken against redacted video or audio to comply with your chain of custody requirements.

COLLABORATE

Manage your redaction workloads by tagging audio or video evidence with its status in the approval workflow for easy project tracking among your team.

Find out how you can save time and costs, and free up valuable resources by automating the redaction of sensitive information: marchnetworks.com/veritone/.
